Central Agricultural University (CAU)  
Pasighat, Arunachal Pradesh*

Access to the appropriate information for agriculture and rural development is a difficult task for the farmers of North-East India. To increase the farm production, the tribal farmers need to be informed on recent scientific farm innovations. In this connection, ICTs hold lot of promise to deliver agricultural knowledge to the tribal farmers. Hence, the Department of Scientific and Industrial Research (DSIR) sponsored research project "e-Arik (e-Agriculture): ICTs for Agricultural Extension" is implemented by the Central Agricultural University at Yagrung village of East Siang district of Arunachal Pradesh state. In order to provide agricultural extension services through Information and Communication Technologies

(ICTs), it is necessary to assess the information needs of the farmers so as to prepare and deliver specific messages or technologies and also to develop ICT based training modules as per farmers' requirements. Hence,

Fig. 1 Village Resource Map (Yagrung-Tekang & Kongkang Villages)

Village Resource Map

a PRA exercise was carried out with the following objectives;

- \* To analyze the tribal farmers resource availability and constraints
- \* To know the farm seasonal activities and crop wise information needs
- \* To understand the tribal farmers household ICT availability and preference.

## METHODOLOGY

The study was conducted in the selected three villages namely, Yagrung, Tekang and Kangkong of Pasighat circle in East Siang district of Arunachal Pradesh. Sixty tribal farmers were randomly selected to conduct the Participatory Rural Appraisal (PRA).

**Table. 1 Farm Seasonal Calendar of Yagrung, Tekang and Kangkong Villages**

| Month                               | January   | February   | March                                 | April  | May   | June  | July  | August  | September                                 | October                                   | November                                       | December                                       |

While selecting the farmers, care was taken to provide proportionate representation to the gender, education levels, and land holding size of the farmers. The selected farmers were divided into groups. Each group was assisted with two PRA facilitators in local dialect.

## PRA METHODS AND FINDINGS

### Village Resource Map

A group of farmers were involved in village resource map drawing and during the process resource base (water, fertility, crops and constraints and opportunities were discussed). The main irrigation source is the rivers Maye, Kime and Tolem.

**Table. 2 Crop wise Information Preference and Ranking** N=18

| Sl. No. | Crop               | No. of Farmers | per-centage | Rank |
|---------|--------------------|----------------|-------------|------|
| 1.      | Khasi Mandarin     | 15             | 83          | 1    |
| 2.      | Assam Lemon        | 12             | 67          | 2    |
| 3.      | Mango              | 11             | 61          | 3    |
| 4.      | Pepper             | 11             | 61          | 3    |
| 5.      | Paddy              | 10             | 56          | 5    |
| 6.      | Bamboo             | 8              | 44          | 6    |
| 7.      | Market information | 8              | 44          | 6    |
| 8.      | Litchi             | 6              | 33          | 8    |
| 9.      | Guava              | 4              | 22          | 9    |
| 10.     | Jackfruit          | 2              | 11          | 10   |

The predominant cropping system is wet rice cultivation, mandarin orange orchards and upland rice cultivation in Jhum lands.

### Farm Seasonal Calendar

In farm seasonal calendar (Table 1), farmers described seasonal variations in crop cultivation, intercultural operations, pest and diseases occurrence and harvesting of farm produce.

### Crop Specific Information Needs-Preference and Ranking Method

A group of 18 farmers expressed information needs on the following crops, including market information needs. Based on their preference, percentage and ranks were worked out.

**Table. 3 Household ICT Availability** N=20

| Sl. No | ICTs       | NO. of Households | %   | Rank |
|--------|------------|-------------------|-----|------|
| 1.     | Radio      | 20                | 100 | 1    |
| 2.     | Telephone  | 12                | 60  | 2    |
| 3.     | Television | 6                 | 30  | 3    |
| 4.     | Computer   | 0                 | 0   | 4    |

**Household ICT Availability – Bar diagram Method**

ICT availability among farmers was assessed using ICT pictures and stones for depicting bar diagram. Among 20 farmers, all farmers possessed radio, 12 farmers had telephone and 6 farmers had television.

*ICT Preference of Farmers- Bar Diagram Method*

A group of 25 farmers were asked to express their preference for ICT for getting farm information. Al-

most equal number of farmers preferred computer with internet (88 per cent), radio (84 per cent) and television (76 per cent). In contrast to this, only four farmers (16 per cent) preferred information through telephone.

**CONCLUSION**

Through Participatory Rural Appraisal, farmers analysed their resource availability, constraints and opportunities

for farming. Further, they diagrammatically depicted the seasonal variations in crop cultivation, intercultural operations, pest and diseases occurrence and farm produce harvesting. Further, the PRA exercise indicated that cent percent of farmers possessed radio. A majority of farmers need the information on Khasi Mandarin, Assam Lemon, Mango, Pepper and Paddy. Most of the farmers preferred internet, radio, and television for getting agricultural information in the “e-Arik: ICTs for Agricultural Extension Services”- village knowledge centre, Yagrung Village, Arunachal Pradesh.

**Table. 4 ICT Preferences of Farmers** N=25

| Sl. No | ICTs                   | No. of Farmers | %  | Rank |
|--------|------------------------|----------------|----|------|
| 1.     | Computer with Internet | 22             | 88 | 1    |
| 2.     | Radio                  | 21             | 84 | 2    |
| 3.     | Television             | 19             | 76 | 3    |
| 4.     | Telephone              | 4              | 16 | 4    |

*Continued from page 26*

government and non-government organisations personnel and media people from New Delhi and Jhansi visited his field and received relevant information. After visiting the field, a number of farmers from the same village and distant villages started agroforestry practices at their fields. In his community Tijju is being referred to as rich man now by villagers.

**FARMER’S OPINION**

The farmer’s opinions are presented in Table-5. The farmer indicated his preference for agrihorti landuse system over sole cropping. He preferred aonla as associate tree species in crop lands on account of its sparse canopy, least bird damage, least theft of fruits, no crop rampage

due to fruit harvesting as fruits are harvested in November i.e. before sowing of wheat crop, high returns and very high market demand for fruits.

The farmer indicated that in near future he is planning to remove his ber and guava plants and replace them by planting aonla.
